

DREADD agonist 21 dihydrochloride

<http://hk.lumiprobe.com/p/dreadd-agonist-21-dihydrochloride>

DREADD agonist 21 (Compound 21, C21) is a synthetic compound for selective activation of hM3Dq (excitatory) and hM4Di (inhibitory) DREADDs (*Designer Receptor Exclusively Activated by Designer Drugs*) derived from the human muscarinic acetylcholine M3 (hM3) receptor. It does not agonize the hM3 receptor and displays weaker binding affinities for histamine H1, serotonin 5-HT2A, 5-HT2C, and α 1A-adrenergic receptors ($K_i = 6, 66, 170, \text{ and } 280 \text{ nM}$, respectively) [1].

DREADD agonist 21 is routinely used as a chemogenetic tool for remotely controlling neuronal activity. It displays excellent brain permeability and capability to activate neurons expressing hM3Dq DREADDs and inhibit activity in neurons expressing hM4Di DREADDs *in vivo* [2].

This product is dihydrochloride salt, a water-soluble version of DREADD agonist 21.
