

HPG (L-Homopropargylglycine)

<http://hk.lumiprobe.com/p/l-homopropargylglycine-hpg>

L-Homopropargylglycine (HPG) is a noncanonical amino acid analog of methionine that contains a terminal alkyne moiety. HPG-labeling is a fast, sensitive, non-toxic, and non-radioactive alternative to the traditional technique for detecting nascent protein synthesis.

HPG is the cell-permeable compound randomly incorporated into synthesizing protein instead of methionine during translation. The resulting alkyne-labeled full-length proteins can be detected via copper-catalyzed click reaction with [fluorescent](#) or [biotin-labeled](#) azides and used for subsequent microscopic imaging or purification tasks.
