## **Proteinase K (lyophilized)**

http://hk.lumiprobe.com/p/proteinase-k-lyophilized

Proteinase K is a non-specific protease of the serine protease family that cleaves peptide bonds adjacent to the carboxylic group of aromatic and aliphatic amino acids. Proteinase K is commonly used to digest proteins in biological samples, remove endogenous nucleases during DNA and RNA purification, unmask antigens in immunochemistry, and prepare tissues for *in situ* hybridization.

Proteinase K is active under a wide range of pH (between 6.5 and 9.5), elevated temperatures, and the presence of metal chelating agents and SDS.

A typical working concentration for Proteinase K is  $50-100 \mu g/mL$ .

Proteinase K is a component of LumiPure Genomic DNA Blood and Buccal Kit.
