

VIC azide, 6-isomer

<http://hk.lumiprobe.com/p/vic-azide-6>

VIC is an asymmetric xanthenone dye with spectral properties similar to [HEX](#) and [JOE](#). Oligonucleotides labeled with VIC are often used in real-time PCR; the preparation of such oligonucleotides can be performed using click chemistry. This derivative is an azide, a pure 6-isomer, for conjugating VIC to other molecules by copper-catalyzed and copper-free click reactions.
