

VU (5-Vinyl-uridine)

<http://hk.lumiprobe.com/p/vinyl-uridine>

5-Vinyl-uridine (VU) is a uridine derivative with a terminal alkene group that can be used for monitoring and investigating RNA transcription in cells instead of [5-ethynyl-uridine \(EU\)](#).

VU is readily taken up by living cells and incorporated by RNA polymerases into *de novo* RNA instead of endogenous uridine, but not into DNA [1]. VU-labeled nascent cellular RNA can be detected quickly and with high sensitivity via inverse electron-demand Diels-Alder cycloaddition reaction (IEDDA) between the vinyl group and fluorescently or biotin-labeled [tetrazines](#).

Labeled RNA can be detected with different cell transcriptional levels estimation methods, e.g., fluorescent microscopy or flow cytometry.
